Low Torque Indicating Ratchet Wrench

Accurately Assess Torque
The Solution Designed To Provide Clinicians With Consistent Low Torque Assessment

The Low Torque Indicating Ratchet Wrench (L-TIRW) is a unique low torque ratchet wrench designed for restorative dentistry. The Low Torque Indicating Ratchet Wrench is sleek and easy to use, providing clinicians with an option they may not have had before: an inexpensive instrument that provides accurate low torque assessment when placing restorative components.

The Low Torque Indicating Ratchet Wrench (L-TIRW) indicates forward and reverse torque of up to 35 Ncm without the need for additional components.

Multi-Functional
The Low Torque Indicating Ratchet Wrench (L-TIRW) doubles as a conventional ratchet wrench to place restorative components and as a torque indicator to provide a visual assessment of torque.

Easy To Separate And Assemble
Consisting of only two parts, the Low Torque Indicating Ratchet Wrench (L-TIRW) is easy to prepare for sterilization and reassemble for use.

Lubrication And Recalibration-Free
The Low Torque Indicating Ratchet Wrench (L-TIRW) does not require lubrication or recalibration. Calibration is confirmed by verifying that the torque indicating arrow is positioned at the first scale mark (0 Ncm).
**Torque Application**

1. When placing a restorative component, use the proper driver tip and ensure complete engagement in the adapter:
   - L-TIRW Standard ISO 1797 Adapter (C9980) or
   - L-TIRW Short ISO 1797 Adapter (C9981)

2. Insert the adapter/driver tip assembly with the knurled handle facing upward into the ratchet wrench. A click will indicate a secure connection within the wrench.

3. During torque application, apply finger pressure along the vertical axis of the knurled handle and restorative component to ensure the driver tip does not back out of the restorative component.

4. Hold the main body and torque arm together with the thumb and index finger.

   The direction of torque application ("IN" marking refers to restorative component insertion and "OUT" refers to restorative component removal) is indicated by the direction of the arrow on the head of the wrench on the same side as the knurled handle of the adapter.

**Torque Indication**

5. To assess the amount of torque being delivered to the restorative component, turn the torque arm in the direction of the arrow on the head of the ratchet wrench on the same side as the knurled handle of the standard adapter when assembled. Read and record torque as indicated.
