Endobon® Xenograft Granules
Endobon Xenograft Granules

Designed To Facilitate Maximum Bone Volume Retention

Endobon Xenograft Granules adhere to one another when hydrated for easy transfer to the defect site.

Small Granules
500–1000 µm particle size preferred for grafting smaller defects, such as extraction sockets.

Large Granules
1000–2000 µm particle size preferred for grafting large defects, such as sinus elevations.

SEM images of Endobon Xenograft Granules at 20x and 100x showing the micro and macro pores in the particles.

Conveniently Packaged In Easy-To-Open Dishes. Value Packs (5 ml and 8 ml) are individually packaged in 1 ml containers for single-unit dosing.

A Bone Graft Substitute
• Bovine-derived hydroxyapatite that has been fully deproteinized by a two-step, high temperature process for protection from bacteria, viruses and prions
• An essentially non-resorbable material that is ideally suited for regeneration of bone defects when effective space maintenance is required
• Osseocoductive due to the interconnecting micro and macro pores for bony integration, which facilitate graft stability and vascular ingrowth

Indications
Endobon Xenograft Granules are indicated for the following dental and/or oral surgical procedures:
• Alveolar ridge augmentation/reconstruction
• Filling of bone defects after root resection, cystectomy and apicoectomy
• Filling a socket after tooth extraction
• Sinus elevation

Anterior Ridge Augmentation
